IoT
PLATFORM

INTERNSHIPS
2017

ABOUT THE PLATFORM

We have been developing IoT projects with companies for some time now. During this period we also got chance to identify the real world, value driven requirements of the IoT applications and then we made our own IoT platform to satisfy these requirements. Our IoT platform is developed to simplify IoT applications and it is not just another cloud platform on the market - it is not strictly cloud platform. The platform provides the customers with application specific hardware devices and software tools necessary to connect things to cloud and manage them seamlessly.

THE INTERNSHIP

At this moment, we are looking for motivated short and long term interns to work on the projects related to the platform. As an intern at Inovatink your focus will be on creating and implementing the valuable ideas related to the platform application in the fields of energy, industrial IoT and Smart City. As an intern, we expect you to;

- Plan and initialize the project.
- Execute on time.
- Document the work.

During your internship, you will be assisted by professionals that have in-depth knowledge about the topic of your project so you will have chance to learn and deliver the meaningful result.

Embedded Developer

The platform consists of devices that need to run specific application code. In the same time the devices can communicate with cloud and get remote updates. All these things are made possible by embedded software that runs on the embedded processors.
For this internship position, we are looking for people who have interest in programming C and microcontrollers.

Web Developer

In the cloud part of the platform we do provisioning and management of devices, device firmware updates, database storage and API management. For this internship position, we are looking for people who have interest in cloud integration. You will have chance to learn a lot of stuff about Amazon Web Services and multi-agent systems (MAS).
